

Revolutionize your office with Essential's Application Sharing Solution

Are your business' mission critical documents at risk?

Are your employees working on laptops or desktops in remote locations? Business documents could be stored on individual hard drives that aren't backed up - your company's data could be scattered, out of your control. Perhaps IT staff are spending inordinate amounts of time on installing the same application and its upgrades on many different computers. Team work, especially where team members are not in the same office (or even in the same country), may be inefficient and cumbersome.

Use EASS!

We are Essential Data Services, a division of Infinity Network Solutions Inc. Our application sharing solution can help your business eliminate redundancy, centralize applications, ensure your data is backed up, and aid collaboration, regardless of operating system. Your data and applications are conveniently stored on our secure servers for easy 24-hour access via the Internet.

"A Mac user in Toronto can share a custom application with someone across the globe in India who is operating on a UNIX platform!"

Essential provides secure, reliable access to your applications and data

Essential's Application Sharing Solution (EASS) is the ultimate in application sharing. The software is installed on our secure, remote servers, along with various applications such as word processing and presentation software, spreadsheets, databases, accounting packages, and more. We provide you with a URL and you login over the internet to your own location on our servers using your unique login name and password. A virtual desktop appears on your screen and you can access your company's applications as if they are installed on your own computer!

Working on a project?

Use EASS to share your work with your colleagues

EASS can lower Total Cost of Ownership and increase Return on Investment!

— Centralize access to data

All users use required applications and store their work, whether in personal folders or in shared company folders, on one remote server.

Eliminate the need to install applications on users' computers; data is centralized and under company control.

— Access any application from anywhere, 24/7

EASS allows users to access their applications and data any time, from anywhere, from any platform through the internet.

Ideal solution for companies with multiple remote offices and employees who are on the road much of the time.

— Efficiency

EASS consumes less bandwidth by publishing only the application's user interface, thus increasing efficiency and performance.

One company using this product said, "Our design engineers can now work more efficiently from home, which means they get more work done."

— Cost beneficial

We deliver significant ROI by reducing costs of deployment and operation, thereby increasing profit margins. TCO is lowered by saving on multiple installations and upgrades.

Most estimates place the Total Cost of Ownership of a traditional working computer system at about 3 to 4 times the actual purchase cost of your IT hardware.

— Daily backups

All data files are stored in a remote location and automatically backed up everyday. Nothing is saved on individual workstations or laptops where it can get lost and it may not be backed up.

10% of laptop computers are stolen or fatally damaged every year and only 4% of laptops are ever backed up.

— Compatibility

EASS eliminates the need for new application management infrastructures and has been designed to work seamlessly within your current environment, regardless of operating system or platform..

Other application sharing solutions need complex software and hardware infrastructures.

— Software Security

A user can only see the files that he has rights to see, and users in a company can use only applications licensed to that company.

One Fortune 500 company said, "We selected (this software) due to its ease-of-use, rich functionality, and built-in encryption and security features."

— Physical Security

EASS servers, and your data, are hosted in one of the most technologically advanced co-locations in North America.

On-site storage isn't safe!

It's essential to access to data with application sharing so
